

Advanced Aspects of Object-Oriented Programming (SS 2010)

Practice Sheet 7

Date of Issue: 20.05.10
Deadline: 02.06.10
(until 10 a.m. as PDF via E-Mail)

Exercise 1 Aliasing

- Give two examples for dynamic aliasing, one where aliasing is desired and one where aliasing has undesired effects.
- Define the relationship between capturing, leaking and aliasing.
- Give a solution to the signers issue on slide 8 of chapter 4.

Exercise 2 Immutable Classes in the JDK

Select five classes from JDK 5 which conform to the definition of immutability as given in the lecture and explain the reason for their immutability.

Exercise 3 Confined Types

Examine the code, available with this practice sheet on the web, with respect to confinedness. The classes `ProofTreeNodeIt` und `ProofContainer` should provide the externally visible interfaces and are thus not confined.

- Examine the class `ConfinedList`. Can we declare this class as confined? Can we modify the implementation as to make this class confined?
- Examine the class `ProofTreeNode` and answer the same questions as above.
- Examine the class `PTNIterator` and answer the same questions as above.

Exercise 4 Encapsulation on Object Level

Consider the class `ConfinedList` from the exercise above. The array stored in the field `data` should be part of the representation of a `ConfinedList`-object, i.e. in the we annotate it with `rep`.

```
class ConfinedList<T> extends AbstractList<T> implements List<T>, RandomAccess, Cloneable, Serializable {  
    ...  
    private /* rep */ transient Object[] data;  
    ...  
}
```

- Is it possible to annotate the remaining parts of the class `ConfinedList`, such that it conforms to the programming discipline presented in the lecture (slide 4.27)? If not, what is the problem with the implementation.
- Which properties can the programming discipline guarantee? Compare them with the guarantees given by confined types.
